Deep Reinforcement Learning

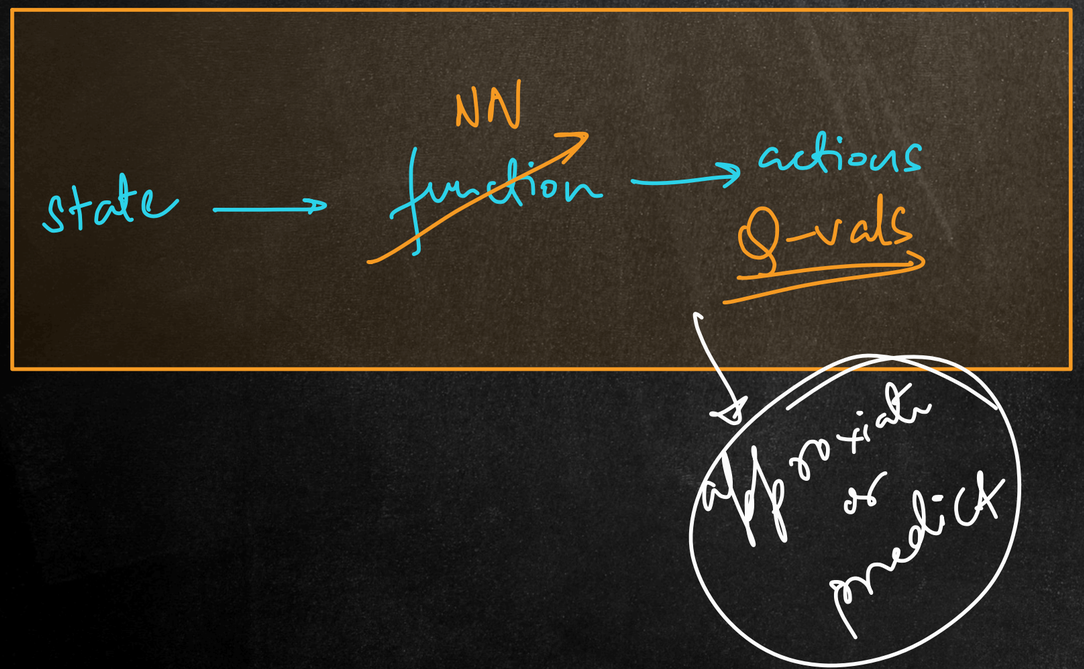

RL + DL

APNA COLLEGE

Q-learning → Q-table $Q(s,a)$ ⟹ 48 states
(discrete, small)

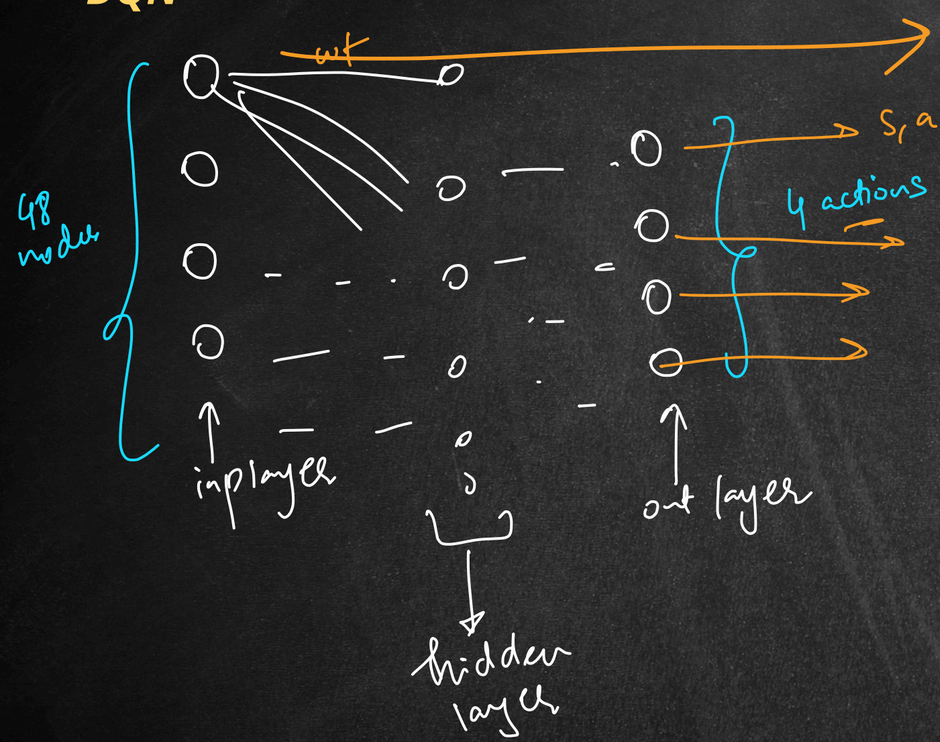

Deep Q-Networks (DQN)

problem
1. millions of states → huge
2. continuous state val → impossible

Deep Q-Networks

DQN

FP
1085
BP

48 × 4 ⟶ q-table
states action
q-val

APNA COLLEGE

Q-learning ⇒ Q(s, a)

DQN ⇒ Q(s, a; θ)

NN parameters

---

1. Correlated samples
2. Moving Target

Deep Q-Networks

Correlated Samples & Experience Replay

Naive DQN

experiences = State, Action, Reward, Next State, Terminal

Problem

NN → independent

① sequential
② correlated

batch size = 16

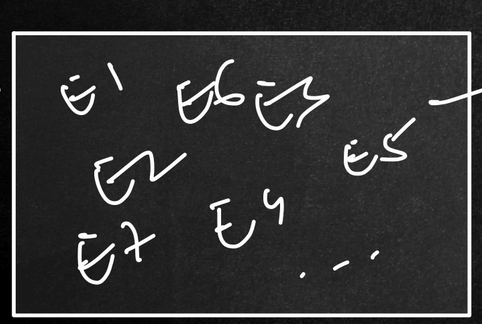

E1: S1 → A1 → R2 → S2
E2: S2 → A2 → R3 → S3
E3: S3 → A3 → R4 → S4

E1 → E2 → E3 ---

✗ E1 → E2 → E3 → E4 ----

✓ E9 → E121 → E2 → E5

Soln: ER ⇒ DQN memory (replay buffer)

→ randomly sample minibatch of Ex

Deep Q-Networks

Moving Target & Target Network

APNA COLLEGE

Q-learning update $\Rightarrow$ $Q(s,a) = Q(s,a) + \alpha\left[r + \gamma \cdot \max_{a} Q(s',a) - Q(s,a)\right]$

leads to $\rightarrow$ unstable training

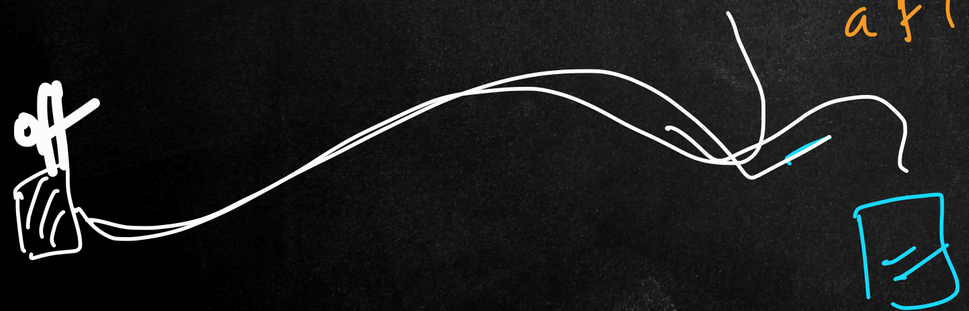

target $\Rightarrow$ $y = r + \gamma \cdot \max_{a} Q(s', a; \theta)$ $\rightarrow y$

predict Q-value $= Q(s', a; \theta) \rightarrow \hat{y}$

$\text{loss} = (y - \hat{y})$

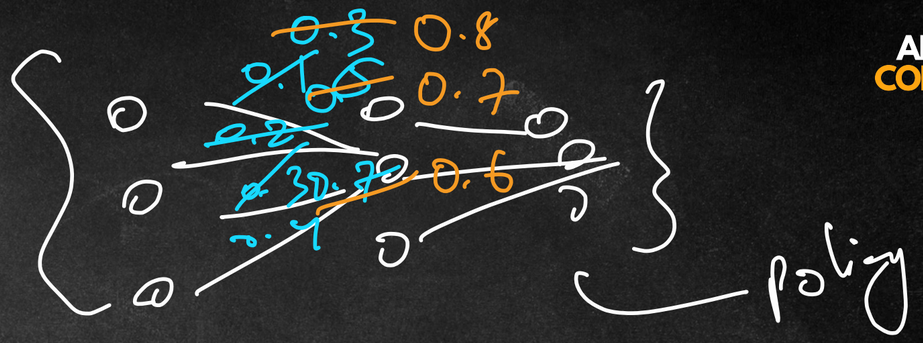

$=$

target is not a FIXED value

Deep Q-Networks

Moving Target & Target Network

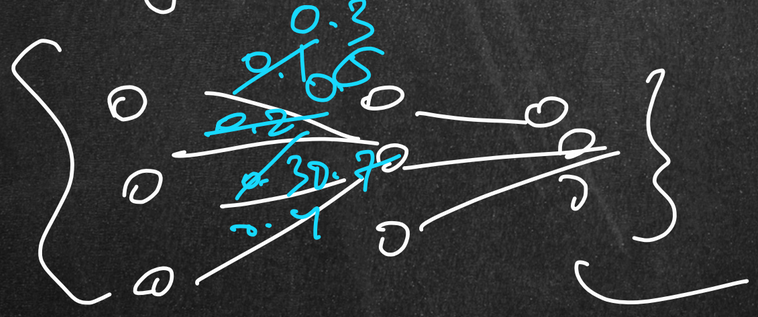

Naive DQN ⟶ 1 NN

DQN

① Policy Network (online)

② Target Network (old copy of policy network)

Architecture
